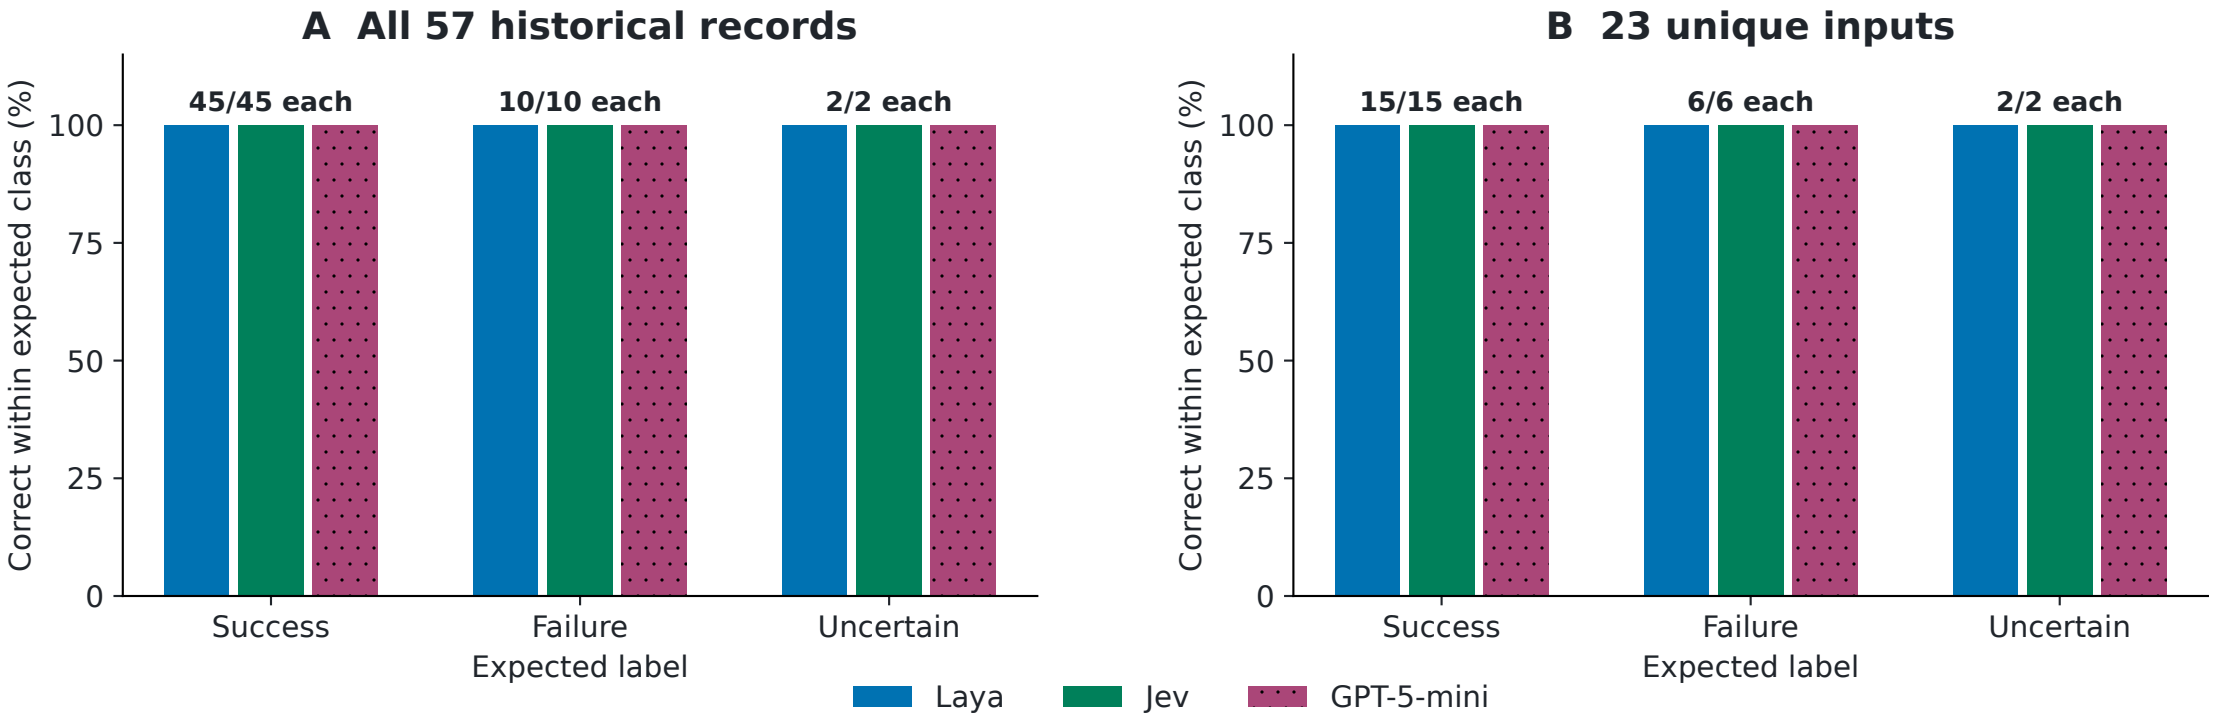
# Tool success: all three models match every expected label

Each input includes its own success, failure and uncertain criteria, plus observed tool evidence.

**57/57 correct per model | 23/23 after deduplication | 0 false-success decisions**



Counts above bars are correct / total. Laya = typed-decisions. Deduplication uses the exact question + evidence hash.

**Perfect on these examples does not establish production reliability: only 6 unique failures and 2 unique uncertain inputs.**
